Solve and show all steps.

<p>A triangle has vertices at $A(1, 2)$, $B(3, 1)$, and $C(2, 4)$. If the triangle is dilated by a scale factor of 3 with the center of dilation at the origin $(0,0)$, what are the new coordinates of its vertices A', B', and C'?</p>	<p>Show all steps here</p>
<p>A quadrilateral has vertices at $P(8, 4)$, $Q(4, 8)$, $R(12, 10)$, and $S(10, 2)$. If the quadrilateral is dilated by a scale factor of $\frac{1}{2}$ with the center of dilation at the origin $(0,0)$, what are the new coordinates of its vertices P', Q', R', and S'?</p>	<p>Show all steps here</p>
<p>A point $X(2, -3)$ is dilated from the origin to create point $X'(8, -12)$. What is the scale factor of this dilation?</p>	<p>Show all steps here</p>
<p>A line segment has endpoints $M(2, 1)$ and $N(4, 5)$. If the segment is dilated by a scale factor of 2 with the center of dilation at $D(1, 0)$, what are the new coordinates of its endpoints M' and N'?</p>	<p>Show all steps here</p>
<p>If a figure is dilated by a scale factor of 1.5, will the new figure be an enlargement, a reduction, or the same size as the original? Explain why.</p>	<p>Show all steps here</p>

Solve and show all steps.

The new coordinates are $A'(3, 6)$, $B'(9, 3)$, $C'(6, 12)$.

The new coordinates are $P'(4, 2)$, $Q'(2, 4)$, $R'(6, 5)$, $S'(5, 1)$.

The scale factor is **4**.

The new endpoints are $M'(3, 2)$ and $N'(7, 10)$.

The new figure will be an **enlargement**. This is because the scale factor (1.5) is greater than 1, meaning all distances from the center of dilation will be multiplied by 1.5, making the figure larger.
